OpenText™ eDirectory is the foundation for the world's largest identity management deployments. It is a high-end directory service that enables businesses to manage identities and secure access for employees, customers, and partners. With OpenText eDirectory, businesses lay the groundwork for secure identity management solutions and multi-platform network services. It provides centralized identity management, infrastructure, net-wide security, and scalability to all applications running behind and beyond the firewall.

It can scale to billions of identities without any performance degradation.

It complies with several open standards including Lightweight Directory Access Protocol version 3 (LDAP v3) standard. This helps organizations maximize their technology investments and avoid getting locked into any vendor's product set.

It is bundled with several world-class enterprise products, such as OpenText™ Identity Manager, OpenText™ Access Manager, and OpenText Open Enterprise Server. It enhances these products by providing a fast, reliable, secure, Open Standards-based high-end identity store. For more information about these products, see the related product documentation.
